

Evisort AI Connector — Capabilities Overview

What Is This?

This connector integrates **Evisort** (Workday Contract Intelligence) with **Claude AI**, giving your legal team the ability to interact with your entire contract repository through natural language conversations. Instead of navigating the Evisort UI manually, team members can simply ask Claude to find contracts, check workflow status, review document metadata, and manage approval processes — all through a conversational interface.

Capability Areas

1. Contract Search & Retrieval

Capability	What It Enables
Full-text contract search	Ask Claude to find contracts by keyword, party name, contract type, or any metadata field — e.g., <i>"Find all MSAs expiring in the next 90 days"</i>
Document lookup	Retrieve any contract by its Evisort ID or your internal document ID
Browse contract library	List and paginate through your entire document repository
Download contracts	Download the original document or the AI-processed version (PDF or DOCX)
AI-extracted provisions	Access Evisort's AI-extracted contract clauses and provisions

Use cases: Due diligence searches, expiration tracking, clause comparison across agreements, finding contracts with specific counterparties.

2. Contract Metadata & Fields

Capability	What It Enables
View all field definitions	See every metadata field configured in your Evisort instance (party names, dates, values, custom fields)
Read contract metadata	Pull the full metadata profile for any contract — parties, effective dates, expiration, value, renewal terms, etc.
Update contract metadata	Modify field values on contracts (e.g., update status, add tags, correct party names)
Provision tagging	Bulk-tag contracts with specific provisions and track tagging progress

Use cases: Contract data quality audits, bulk metadata updates, reporting on contract field coverage, identifying contracts missing critical fields.

3. Workflow & Approval Management

Capability	What It Enables
View available workflows	See all published contract workflows (e.g., NDA review, vendor onboarding, renewal approval)
Check intake forms	Review what information is required to submit a contract request
Submit contract requests	Create new workflow tickets (contract review requests, approval requests)
Track request status	Check where a contract request stands in the approval pipeline
View participants	See who is involved in a given contract review

Use cases: Checking status of pending approvals, understanding what workflows are available, reviewing intake requirements before submitting requests.

4. Approval & Review Actions

Capability	What It Enables
Advance workflow stages	Move a contract request to its next stage in the pipeline
Approve or reject	Issue approval/rejection decisions on pending judgments
Reassign reviewers	Redirect a pending approval to a different team member
Complete or cancel requests	Close out finished reviews or cancel abandoned ones
Upload signed documents	Attach the final executed version of a contract
Track document versions	View and download all versions of a document throughout its review lifecycle

Use cases: Approving contracts during conversations with Claude, checking what's waiting for your signature, reassigning reviews when someone is OOO, uploading executed agreements.

5. Activity & Audit Trail

Capability	What It Enables
Activity logs	View the activity history for any contract or workflow entity
System audit logs	Pull comprehensive audit trail data across the entire Evisort instance
Batch audit retrieval	Export large volumes of audit data (up to 7,500 records per batch) with continuation support

Use cases: Compliance audits, investigating who accessed or modified a contract, generating audit reports for regulators, tracking approval chain history.

6. User Administration

Capability	What It Enables
Export user list	Download the current list of all Evisort users
Bulk user import	Upload spreadsheets to add or update users in bulk
Track import status	Monitor the progress of bulk user operations
Review import errors	Identify and troubleshoot failed user imports

Use cases: User access reviews, onboarding new team members, periodic user audits, deprovisioning.

Security & Access Control

- **Read/Write separation** — Every capability is classified as either read-only or write (modification). Users can be granted read-only access to prevent accidental changes.
- **API Key authentication** — Access is controlled through Evisort API keys, inheriting the same permissions as the associated Evisort user account.
- **No data storage** — The connector passes data directly between Claude and Evisort in real-time. No contract data is cached or stored outside of Evisort.
- **Audit trail** — All actions taken through the connector are logged in Evisort's audit system, just like any other API access.

Example Conversations

"Show me all vendor agreements with Acme Corp that expire this year" Claude searches Evisort, returns matching contracts with expiration dates and key terms.

"What contracts are waiting for my approval?" Claude lists pending workflow tickets assigned to you with their current stage and submission date.

"Download the latest version of the signed MSA for Project Atlas" Claude locates the document, identifies the most recent signed version, and provides the download.

"Who has access to our Evisort instance?" Claude exports the user list and summarizes roles and access levels.

"Show me the audit trail for changes to contract #12345 in the last 30 days" Claude pulls the activity log and presents a timeline of who viewed, edited, or approved the contract.

Summary

Area	Tools	Read	Write
Contract Search & Retrieval	8	8	0
Contract Metadata & Fields	7	4	3
Workflow & Approval Management	5	4	1
Approval & Review Actions	10	3	7

Activity & Audit Trail	3	3	0
User Administration	7	4	3
Total	43	26	14

3 tools serve dual purposes (provision creation is technically a write but classified under fields/read context)
